---

We are pleased to present Volume 2, Issue 4 of the *Journal of Computers, Mechanical and Management (JCMM)*, a collection that reflects the journal's interdisciplinary focus on advancing research in engineering, technology, and management sciences. This issue includes six contributions that provide insightful perspectives on current challenges and innovations in fields ranging from AI applications to quantum technology and sustainability. The issue opens with an original research article on enhancing digital accessibility for visually impaired individuals through a voice-based email system using artificial intelligence [1]. This study introduces a novel system that combines AI with speech recognition to convert speech to text, significantly improving the digital communication experience for visually impaired users. The proposed solution represents an important step towards inclusivity in technology-driven communication. Another original research article presents a comprehensive CAMEL analysis of commercial banks in Nepal [2]. This study assesses the financial soundness of these institutions, providing insights into their stability and operational efficiency. By examining factors such as capital adequacy, asset quality, and management quality, this article contributes valuable data for policymakers and stakeholders in the banking sector. In the realm of quantum technologies, an original research article explores the design of a multi-operative reversible gate for quantum-based parity generators [3]. This work emphasizes the potential of quantum logic for future high-speed, low-power computation and data security applications. It highlights the use of quantum-dot cellular automata (QCA) as a viable alternative to CMOS technology, which could revolutionize computational architecture. Additionally, this issue features a mini-review examining the implications of the Goods and Services Tax (GST) on the sustainability of India's handicraft sector [4]. The authors explore how GST has influenced taxation, production, and sustainability practices, underscoring its impact on one of India's culturally significant industries. This review provides a thorough analysis of GST's role in promoting economic and environmental sustainability within the handicraft sector. Another review article explores entrepreneurial prospects in the marine industry [5]. This comprehensive study discusses potential avenues for innovation and economic growth within marine biotechnology, aquaculture, and eco-tourism, emphasizing the need for sustainable practices in the utilization of marine resources. This article highlights the largely untapped potential within the marine sector and encourages further exploration of these opportunities. Finally, the issue closes with a critical review of aluminum matrix composites reinforced with MgO particulates, which assesses their mechanical and wear resistance properties [6]. Given the growing demand for lightweight and durable materials in sectors like aerospace and automotive, this review provides insights into the advancements in composite materials that offer enhanced performance characteristics.

As JCMM continues to expand its reach and impact, we are grateful for the contributions of our authors, reviewers, and editorial board. We trust that this issue will spark dialogue and further research within these dynamic fields. We look forward to fostering continued scholarly engagement as we strive to bridge disciplines and promote innovation across engineering, computer science, and management sciences.
